

Deployment

Deployment is the process of moving the completed solution into the client's production environment where it becomes available to end users.

Deployments should follow standardized procedures to minimize operational risks and service disruptions.

Pre-Deployment Activities

Before deployment, ensure:

- QA approval completed
- Client sign-off received
- Infrastructure prepared
- Backup procedures completed
- Rollback plan documented
- Monitoring enabled

Deployment Tasks

Typical deployment includes:

- Container deployment using Docker
- Database migration
- API configuration
- Domain setup
- SSL configuration
- Environment variable configuration
- Monitoring activation
- Smoke testing

Post-Deployment

After deployment, the reseller should:

- Verify system functionality
- Monitor system performance

- Resolve immediate issues
- Provide client support
- Confirm successful production release

Deployment is considered successful only after the client confirms that the solution operates according to agreed requirements.
